1. Introduction

A2Z Corporation is a mid-sized company that manages sensitive customer information, including payment details and personally identifiable information. To protect its network security, the company has implemented several security measures, including encryption, firewalls, and intrusion detection systems (IDS). These mechanisms are designed to protect data in transit, manage network traffic, and detect potential threats in real time. Although the company used these measures, the company still faces various internet-facing risks, therefore requiring it to build a robust network and continuously assess its security posture.

2. System Design and Security Analysis

Internet-Facing Security Risks

A2Z Corporation faces several security threats due to its public-facing services

1. Unauthorized Access to Internal LAN: Attackers may attempt to exploit misconfigured routers or open ports to access sensitive administrative systems.
2. Attacks on Public Web Server: The DMZ-hosted web server is exposed to potential threats such as DDoS attacks, force login attempts and web application vulnerabilities.
3. Malware and Phishing Attacks: External sources could attempt to introduce malware or phishing content into the network, threatening sensitive data.
4. Reconnaissance Activities: Cyber attackers may scan open ports or exploitable services, aiming to gather information for subsequent attacks.

System Architecture Diagram

The proposed network architecture uses segmentation, controlled access and traffic filtering to mitigate these risks.

1. Network Segmentation:
 - DMZ (192.168.10.0/24): Contains the web server (192.168.10.1/24). allow only HTTP (port 80) and HTTPS (port 443) to the internet.
 - Internal LAN (192.168.20.0/24): Contains Admin-PC (192.168.20.1/24). Fully isolated from inbound internet traffic.
 - The router interfaces are isolated networks: Gig0/0 connects to the internet (203.0.113.2), Gig0/1 to DMZ, and Gig0/2 to the internal LAN.
2. Firewall Policies:
 - Inbound to DMZ: Only HTTP (80) and HTTPS (443) traffic is allowed. All other ports are blocked.
 - Inbound to Internal LAN: Completely blocked.
 - Outbound to Internal LAN: The administrator PC can access the internet and DMZ to manage the web server.
3. Device Placement and Connectivity:
 - Internet (Cloud): IP 203.0.113.1 connected to router Gig0/0 via a copper straight-through cable.
 - Router: Edge router handling routing and firewall policies. Interfaces:
 - G0/0 → Cloud

- G0/1 → SW-DMZ
 - G0/2 → SW-LAN
- Switches:
 - SW-DMZ connects to router G0/1 and DMZ-WebServer FastEthernet0.
 - SW-LAN connects to router G0/2 and Admin-PC FastEthernet0.
- Server: Ubuntu web server in DMZ, IP 192.168.10.1.
- Admin-PC: Internal workstation, IP 192.168.20.1.
- Cables: All copper straight-through.
- Security:
 - Firewall configured on router interfaces (G0/0, G0/1, G0/2).
 - Only required ports open, DMZ exposed to HTTP/HTTPS, internal LAN isolated.

4. Encryption and Monitoring:

- HTTPS (port 443): Ensures encrypted traffic between external users and the web server.
- Potential IDS/IPS in Packet Tracer simulation: Can monitor unusual traffic in DMZ and internal LAN, alerting administrators to intrusion attempts.

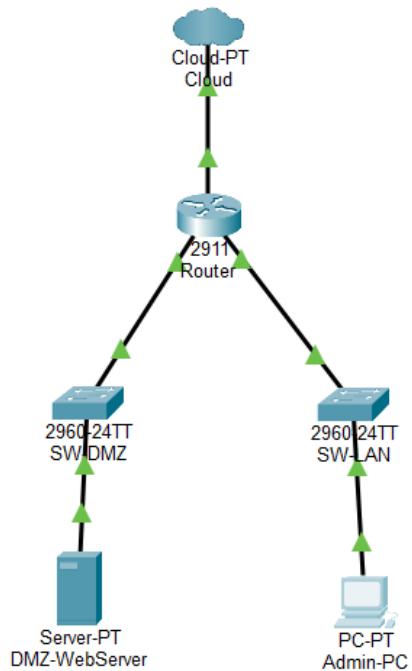

Figure 1

Justification of design choices

1. Segmentation: Separating DMZ from the internal LAN ensures that even if the web server is compromised, the core administrative systems remain protected.
2. Controlled Access: By allowing only essential ports and blocking all other traffic, the network reduces the attack surface and prevents common exploits.
3. Routing and Firewall Placement: Placing the firewall rules on router simplifies traffic control and ensures a central point of policy enforcement.
4. Encrypted Traffic: Using HTTPS ensures data confidentiality for clients accessing public services, mitigating risks of eavesdropping or data tampering.
5. Future IDS/IPS Integration: Although optional in Packet Tracer, adding monitoring systems would enhance detection of abnormal activities and support proactive security.

3. Implementation of Security Measures

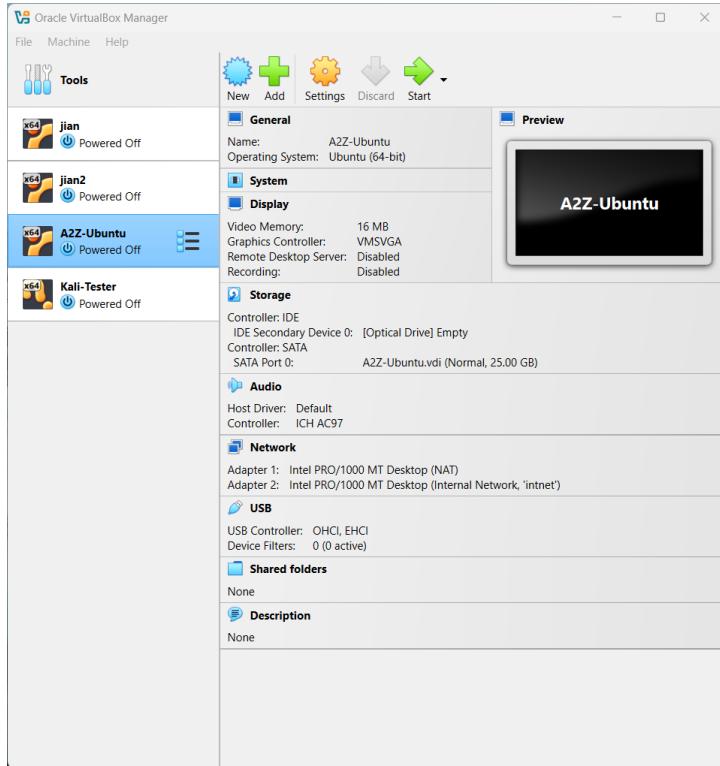

Figure 2

Copyright (C) 1998-2013 Sourcefire, Inc., et al.
Using libpcap version 1.10.4 (with TPACKET_V3)
Using PCRE version: 8.39 2016-06-14
Using ZLIB version: 1.3
```

Figure 26

Figure 26 is after setting all the interface and IP address, snort -V is to determine which version of the Snort is installed.

```
jiajan@jiajan-VirtualBox:~$ sudo nano /etc/snort/snort.conf
[sudo] password for jiajan:
```

Figure 27

Figure 27 is I should type the Ubuntu virtual machine's IP address as a HOME_NET, so I type this command.

```
# Note to Debian users: this value is overriden when starting
# up the Snort daemon through the init.d script by the
# value of DEBIAN_SNORT_HOME_NET s defined in the
# /etc/snort/snort.debian.conf configuration file
#
ipvar HOME_NET 192.168.10.1/24

# Set up the external network addresses. Leave as "any" in most situations
ipvar EXTERNAL_NET any
# If HOME_NET is defined as something other than "any", alternative, you can
# use this definition if you do not want to detect attacks from your internal
# IP addresses:
#ipvar EXTERNAL_NET !$HOME_NET
```

Figure 28

Figure 28 shows the HOME_NET already set as 192.168.10.1/24.

```
# Path to your rules files (this can be a relative path)
# Note for Windows users: You are advised to make this an absolute path,
# such as: c:\snort\rules
var RULE_PATH /etc/snort/rules
var SO_RULE_PATH /etc/snort/so_rules
var PREPROC_RULE_PATH /etc/snort/preproc_rules
```

Figure 29

Figure 29 shows The RULE_PATH variable in the snort.conf file determines the location of the snort rule files.

```

# site specific rules
include $RULE_PATH/local.rules

# The include files commented below have been disabled
# because they are not available in the stock Debian
# rules. If you install the Sourcefire VRT please make
# sure you re-enable them again:

#include $RULE_PATH/app-detect.rules
include $RULE_PATH/attack-responses.rules
include $RULE_PATH/backdoor.rules
include $RULE_PATH/bad-traffic.rules
#include $RULE_PATH/blacklist.rules
#include $RULE_PATH/botnet-cnc.rules
#include $RULE_PATH/browser-chrome.rules
#include $RULE_PATH/browser-firefox.rules
#include $RULE_PATH/browser-ie.rules
#include $RULE_PATH/browser-other.rules
#include $RULE_PATH/browser-plugins.rules
#include $RULE_PATH/browser-webkit.rules
include $RULE_PATH/chat.rules
#include $RULE_PATH/content-replace.rules

# $Id: local.rules,v 1.11 2004/07/23 20:15:44 bmc Exp $
# -----
# LOCAL RULES
# -----
# This file intentionally does not come with signatures. Put your local
# additions here.

alert icmp any any -> $HOME_NET any (msg:"ICMP Detection Rule"; sid:1000001;)
alert tcp any any -> $HOME_NET 22 (msg:"SSH Connection Attempts"; sid:1000002;)
alert tcp any any -> $HOME_NET 80 (msg:"Command Execution Attempt"; content:"GET"; content:"/etc/passwd"; sid:1000003;)
```

Figure 33

Figure 33 shows I set three alerts, first is generate an alert when an ICMP traffic is received from any source IP Address to Ubuntu. Second is create a snort rule to detect SSH connection attempts and last create a snort rule to detect a command execution attack which contains /etc/passwd in the http GET request.

4. Testing

In this assessment, I used Nmap, tcpdump and Snort IDS to identify vulnerabilities in the test network. The target machine Ubuntu server with IP address 192.168.10.1 was hosting two services:

- Nginx on port 80
- DVWA on port 8080
- Snort IDS running in docker on Ubuntu
- Kali Linux used as attacker machine.

From these tools, I identified several vulnerabilities explained below.

Vulnerability 1 - Port 80 (HTTP) is Open Without Encryption

Evidence

From nmap

80/tcp open http

Reasoning

HTTP on port 80 sends data in plain text, including:

- Cookies
- Login information
- Session tokens
- Web requests

An attacker can capture this traffic using tcpdump or Wireshark

Risk Level

Medium to High

Because attackers in the same network can sniff traffic and steal sensitive data.

Recommended Fix

- Enable HTTPS with SSL/TLS certificates
- Redirect all HTTP traffic to HTTPS
- Disable plain HTTP if not needed

Vulnerability 2 - DVWA (Port 8080) Running in “Low Security Mode”

Evidence

From tcpdump on port 8080:

HTTP/1.1 200 OK

DVWA login page

From the browser: DVWA accessible without restriction.

Reasoning

DVWA in low security mode contains intentional vulnerabilities:

- SQL Injection
- XSS
- Insecure file upload
- Command execution
- CSRF

If a malicious user accesses DVWA, they can exploit these vulnerabilities to attack the server or compromise network.

Risk Level

High

DVWA is purposely vulnerable.

Recommended Fix

- Never expose DVWA to a real production network
- Use firewall rules to only allow trusted hosts
- Run DVWA in an isolated environment / VM only

Vulnerability 3 - Port 80 (Nginx) Traffic Not Captured by tcpdump

Evidence

- `tcpdump -i enp0s8 port 80` shows no packets when Kali accesses `http://192.168.10.1`.
- But `tcpdump -i enp0s8 port 8080` shows GET / 200 OK when accessing DVWA.
- This means port 80 traffic is not passing through enp0s8.

Reasoning

Nginx on port 80 is likely bound to the NAT interface, not the internal network interface enp0s8.

Because of this, tcpdump and Snort cannot see or monitor port 80 traffic, creating a monitoring gap.

Risk Level

Critical - Attacks on port 80 bypass Snort and tcpdump, allowing undetected exploitation of the web server.

Recommended Fix

- Bind Nginx to the internal network IP (192.168.10.1).
- Re-run the container with correct port mapping.
- Verify that port 80 traffic goes through enp0s8 so Snort and tcpdump can inspect it.

```

Figure 39

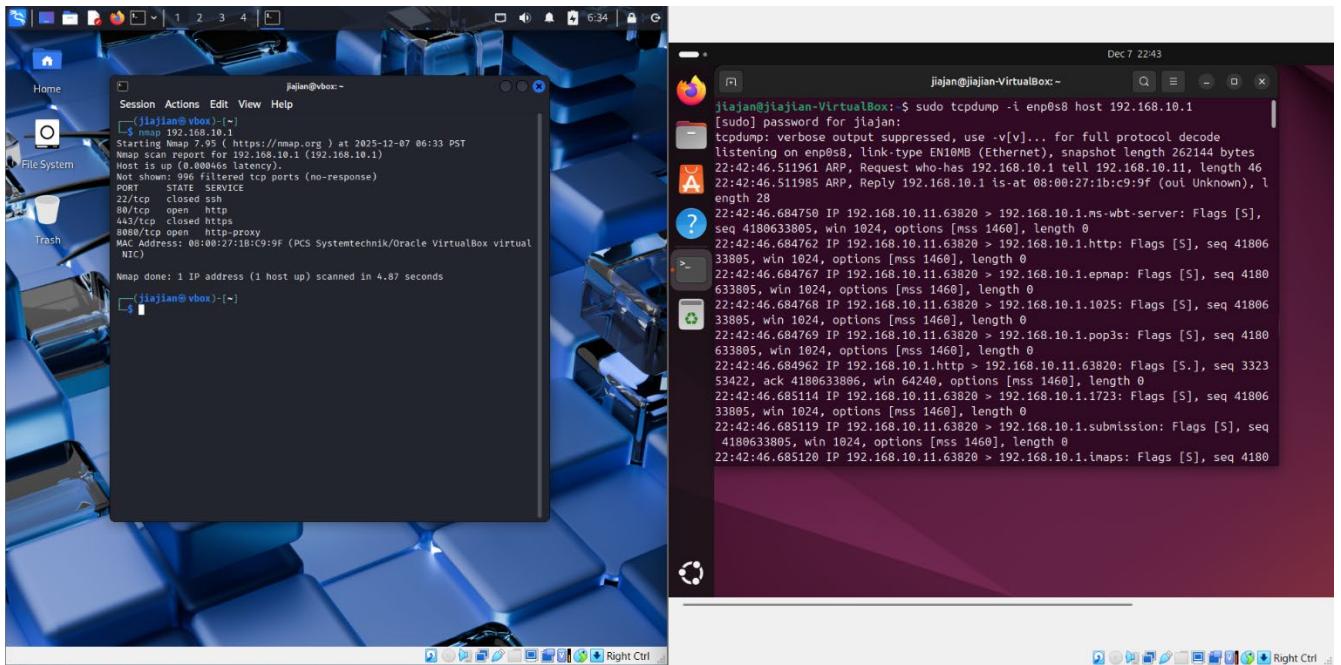

Figure 40

Figure 40 is capture nmap scan traffic, from Ubuntu run the command and on Kali-Tester run namp 192.168.10.1. The tcpdump will show the log.

5. Conclusion

In this project, I used open-source tools such as UFW, Docker, Nginx, DVWA, Snort, Nmap, and tcpdump to secure and test A2Z Corporation's network system. By setting up the firewall, running web services in containers, and monitoring traffic with Snort and tcpdump, I was able to understand how different security layers protect a real environment.

During testing, I identified three main vulnerabilities. First, port 80 was open and using HTTP without encryption, which means data could be intercepted or modified. Second, DVWA running on port 8080 was in low security mode, making it easy for attackers to exploit common web vulnerabilities. Third, the traffic to Nginx on port 80 was not captured by tcpdump, meaning Snort and monitoring tools could not detect attacks on that service. These weaknesses showed how important correct configuration and monitoring are for network security.

Based on these results, I recommended using HTTPS instead of HTTP, running DVWA only in a controlled testing environment, and making sure Nginx is bound to the correct network interface so traffic can be monitored.

Overall, the security design improved A2Z Corporation's system by reducing risks, increasing visibility, and ensuring better protection against attacks.
